NEWS RELEASE

Breathing dirty air may harm kidneys

Health risks go up as air quality goes down

by **Kristina Sauerwein** • September 21, 2017

Outdoor air pollution may increase the risk of chronic kidney disease and, ultimately, contribute to kidney failure, according to researchers at Washington University School of Medicine in St. Louis and the Veterans Affairs (VA) St. Louis Health Care System.

Outdoor air pollution has long been linked to major health conditions such as heart disease, stroke, cancer, asthma and chronic obstructive pulmonary disease. A new study now adds kidney disease to the list, according to researchers at Washington University School of Medicine in St. Louis and the Veterans Affairs (VA) St. Louis Health Care System.

Pollution may increase the risk of chronic kidney disease and, ultimately, contribute to kidney failure, according to the researchers.

The Washington University team, in collaboration with scientists at the Veterans Affairs' Clinical Epidemiology Center, culled national VA databases to evaluate the effects of air pollution and kidney disease on nearly 2.5 million people over a period of 8.5 years, beginning in 2004. The scientists compared VA data on kidney function to air-quality levels collected by the Environmental Protection Agency (EPA) as well as the National Aeronautics and Space Administration (NASA).

The EPA derived its data from land-based air-monitoring stations across the U.S. The findings suggest that 44,793 new cases of kidney disease and 2,438 new cases of kidney failure may be attributed to levels of air pollution that exceed the EPA's threshold of 12 micrograms per cubic meter of air, which is the highest level of air pollution considered safe for the public, as set by the Clean Air Act of 1990 and updated in 2012.

The study is published Sept. 21 in the Journal of the American Society of Nephrology.

"Data on the relationship between air pollution and kidney disease in humans has been scarce," said **Ziyad Al-Aly, MD**, the study's senior author and an assistant professor of medicine at Washington University. "However, once we analyzed the data, the link between air pollution and the development of kidney disease was clear."

Al-Aly

Fine particles can damage the kidneys in the same way they damage other organs such as the heart and lungs. Airborne and invisible, microscopic pieces of dust, dirt, smoke, soot and liquid droplets often become destructive when they invade the bloodstream. The kidneys filter the blood, and these harmful particles can disrupt normal kidney function.

The study found that even low levels of particulate matter may adversely affect the kidneys. And those adverse effects increase as pollution levels increase.

"The higher the levels of air pollution, the worse it is for the kidneys," said Al-Aly, who is also the VA's director of clinical epidemiology in St. Louis. "However, no level is completely safe. Even at relatively low levels, there was a relationship between particulate matter concentrations below the EPA thresholds and kidney disease."

Researchers also linked the VA data to space-borne sensors from NASA satellites. "NASA data and EPA data yielded consistent results," Al-Aly said.

"The beauty of using both EPA and NASA data is that the agencies used two distinct techniques for collecting data, yet the results were similar," he said. "This constellation of findings suggests that chronic exposure to air pollution is a significant risk factor for the development and progression of kidney disease."

Study results placed Southern California and large regions in the South, Midwest and Northeast at the greatest risk for kidney decline attributed to air pollution.

Over the years, unsafe levels of outdoor air pollution have decreased in the U.S. Still, more than half of the U.S. population lives in areas — from industrialized big cities to farming communities to coal-mining towns — with unhealthy levels of outdoor air pollution, according to a 2016 study by the American Lung Association.

In many places across the globe, including China and India, outdoor air pollution is significantly worse than in the U.S.

"In our analyses, the risk of chronic kidney disease and its progression was most pronounced at the highest levels of fine particulate matter concentration," Al-Aly said. "This suggests further study is needed for a broader assessment of the global burden of kidney disease attributable to air pollution."

This research was funded by the U.S. Department of Veterans Affairs.

Washington University School of Medicine's 2,100 employed and volunteer faculty physicians also are the medical staff of Barnes-Jewish and St. Louis Children's hospitals. The School of Medicine is one of the leading medical research, teaching and patient-care institutions in the nation, currently ranked seventh in the nation by U.S. News & World Report. Through its affiliations with Barnes-Jewish and St. Louis Children's hospitals, the School of Medicine is linked to [BJC HealthCare](#).

Consistently ranked a top medical school for research, Washington University School of Medicine is also a catalyst in the St. Louis biotech and startup scene. Our community includes recognized innovators in science, medical education, health care policy and global health. We treat our patients and train new leaders in medicine at Barnes-Jewish and St. Louis Children's hospitals, both ranked among the nation's best hospitals and recognized for excellence in care.
